Boot Camp

Dave Eckhardt de0u@andrew.cmu.edu

This Is a Hard Class

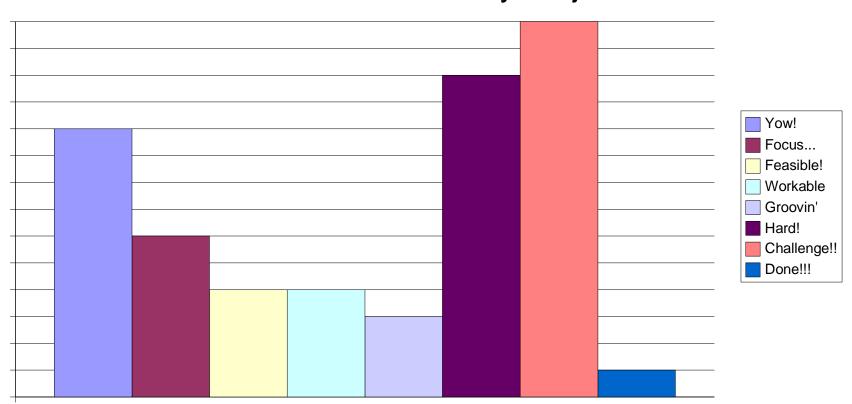

- CS doesn't have "capstone" classes, but similar...
- Traditional hazards
 - 410 letter grade one lower than typical classes
 - All *other* classes this semester: one grade lower

Aim

- If you aim for a B you might not get one
- If you aim for a C you might not get one
- "I'll drop if I can't get an A"
 - (You *must* discuss this with your partner *early*)

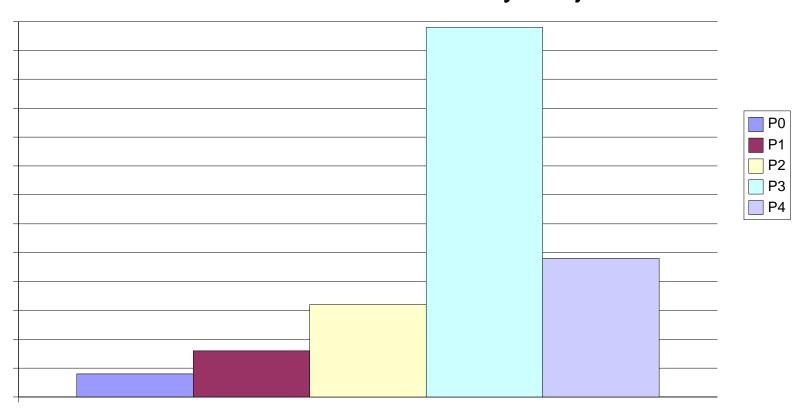

The Shape of a Class

Effort/Excitement by Project

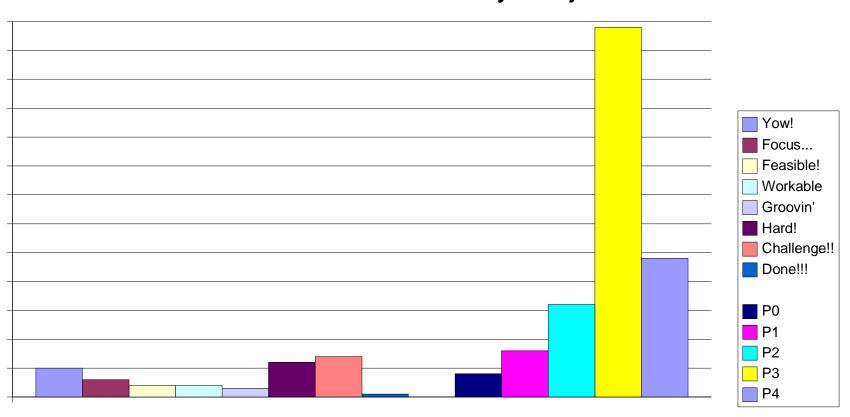

15-410

Effort/Excitement by Project

Beware Optical Illusions!

Effort/Excitement by Project

Implications

- "Trouble with one assignment" is *real* trouble
 - You can't just "swing at the next ball"
 - The next ball is two to four times faster!
 - Each assignment is training for the next (like Math)
 - If you skip part of one assignment, the next one may be *unachievable*.
- So...
 - Aim to do *really well* on P0
 - Start *the first day* (*for sure* by the second)
 - Then recover, aim to do even better on P1

Good News

- Good news...it can be done!
 - Spring 2010
 - Two groups dropped
 - One "lone wolf" dropped
 - Two groups half-dropped (merged into one, finished ok!)
 - One group split
 - All other groups turned in working kernels
- Remainder of this lecture
 - How to get from here to there

This is a *Transformative* Class

- Genuine achievement, available to you
 - What is an OS, *really?*
 - Concurrency (locks, races, deadlock)
 - What is VM, really?
 - Process model, C run-time model
 - Interrupts
 - Design synthesis, planning
 - Serious competence in debugging!
- If that sounds like a lot, it is!

Work Flow – You may be used to...

- Assignment handout ⇒ code outline
- Compilation implies correctness
- Graded by a script
- All done!
 - Never use it again
 - Delete it at end of semester
- Total opposite of real life

Work Flow – 410 Additions

- Design
- Divide into parts
- Manage your partner
- Merge
- Debug *hard* problems

Surprises

- "Code complete" means "I am far behind"
 - Merge can take *three days*
 - Then you *start* to find bugs (1-2 weeks)
- Code with "the right idea" will *immediately* crash
 - If you're lucky!
- This is not a "basic idea is right" class
 - You can't ship "basic ideas" to customers
 - Understand all details—*then* you have the basic idea

Interlude

- What is source code "for"?
 - What is done with it?

Interlude

- The purpose of code is for *people to read*
 - By a reviewer / security auditor
 - By your group
 - By your manager
 - By your successor
 - By you six months later (6 hours later if no sleep)
- Oh, yeah, the compiler reads it too

On Debugging

As soon as we started programming, we found to our surprise that it wasn't as easy to get programs right as we had thought. Debugging had to be discovered. I can remember the exact instant when I realized that a large part of my life from then on was going to be spent in finding mistakes in my own programs.

- Maurice Wilkes (1949)

Debugging

- Bugs aren't just last-minute glitches
- They are crucial learning experiences
 - Learning a lot can take a lot of time

What Does A Bug Mean?

- "It tells me 'triple fault' why??"
 - Research: 20 minutes
 - Think: 20 minutes
 - Debug: 2 hours.
 - ...three times.
- May need to write code to trap a bad bug
 - Asserts or more-targeted debug module
- Then you will find your design was wrong!
 - Don't be shocked this is part of 410 / life

"All Done"?

- Finally, when you're done...
 - You will use your code for the next assignment!
 - We will read it (goal: every line)

Confront the Material

- We are doing printf() all the way down
 - Subroutine linkage, how & why
 - Stub routine, IDT entry, trap handler wrapper
 - Output/input-echo interlock
 - Logical cursor vs. physical cursor
 - Video memory (what does scrolling mean?)
- Can't really gloss over *anything*

Confront Debugging

- Real life: you will debug other people's code
 - Any bug could be yours, partner's, ours, or Simics; you need to *find* it.
- *Can't* debug using only printf()
 - printf() changes your code
 - printf() may be broken by whatever breaks your code
 - Learn the Simics debugger
 - Assertions, consistency checks
 - Debugging code

On Investing

- A week of coding can sometimes save an hour of thought.
 - Josh Bloch

Confront Debugging

- ½ hour of studying the debugger
 - vs. 2 days of thrashing
- Papering over a problem
 - Re-ordering object files to avoid crash

Warning About 15-213

- It's an absolutely vital class
- We expect you to *know*
 - Byte, word, register, 1<<2
 - Thread, stack
 - malloc(), free() (when & why)
 - how to translate $C \Leftrightarrow x86$
- Trouble with 213?
 - If you didn't get a B or an A, see me
 - If the malloc() lab didn't go well, see me

Warning to Graduate Students

- This is an undergraduate class
 - There will be "a diversity of grades"
- Getting "average grades on every assignment" most likely means a C, not a B
 - "Everything pretty much worked" is C territory
 - B requires *repeated solid performance*
- Working really hard and doing everything somewhere between "ok" and "well" may mean a B, not an A.
 - A requires *repeated excellence*

How to Have Trouble

- How to get an R
 - Arrive unprepared (e.g., barely escape 123, 213)
 - Do everything at the last minute
 - Don't read the book or come to class
 - Hide from course staff no matter what
- How to get a D
 - Don't get the kernel project genuinely working
 - (There are other ways, but this one is popular)

Doing Well – Embrace the Experience

- Embrace the Unix development experience
 - If you try to keep it at arm's length it will slow you down
- Embrace the Simics debugger
 - If you try to keep it at arm's length it will slow you down
- Embrace source control
 - If you keep it at arm's length ...

Doing Well – Invest in Good Code

- Mentally commit to writing *good* code
 - Not just something kinda-ok
 - You will *depend* on your code
- Anand Thakker (Fall 2003)
 - Remind yourself that you love yourself...
 - ...so you should write good code for yourself

Doing Well – Start Early

- Starting a week late on a 2-week project will be bad
- Not making "just one" checkpoint can be bad
 - Missing two kernel-project checkpoints...
 - ...may make passing impossible.

Doing Well – Read Partner's Code

- You will *need* to read everything your partner wrote
 - (and answer test questions about it)
- Set up a mechanism
 - Daily meeting? Careful reading of merge logs?
- Do "one of each"
 - Partner does N-1 stub routines, you should do the hardest

Doing Well – Time for Design

• "Design" means you may need to think overnight

How to get an A

- Understand *everything*
 - (consider 2-3 ways to do each thing, pick the best)
- Write genuinely excellent code
 - asserts, good variable names, source control
- Document *before* coding
 - Actual 15-410 students do this!
- Read *all of* your partner's code
- Work *with* your partner (merge *continuously*)
- Be "done" *early*, "just in case"

First Item of Work

- Read the syllabus
 - It contains things you need to know
 - Things which will be painful surprises if you don't know them
- Thanks!
